### DETAILED ACTION

1. Applicant's arguments with respect to claims 1-3, 14-16, 27, and 28 have been considered but are moot in view of the new ground(s) of rejection.

#### *Claim Rejections - 35 USC § 102*

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

3. Claims 1-3, 14-16, 27 and 28 are rejected under 35 U.S.C. 102(e) as being anticipated by McConnell et al (U.S. Patent No. 6,108,307).

Regarding claims 1, 3, and 28, McConnell et al (McConnell) discloses a processor implemented method of scheduling data packets for transmission over a communication link in a network, the method comprising the steps of:

computing delay measures for a plurality of packets including at least one packet (a Frame Relay message in FIG.1 ) from each of a plurality of queues Q1-Q4 in FIG. 3), i.e., measuring a current age (delay in the queue) of the message at the head of each queue (col. 7, lines 48-50); and

selecting a given one of the plurality of packets for transmission based on at least in part on a comparison of weighted version of the computed delay measures, such that the selected

Art Unit: 2663

packet is the packet having the largest weighed delay associated therewith (col. 8, line 10-col. 9, line 10).

Examiner understands that the weighed version of the computed delay and the largest weighted are equivalent to the congestion severity status for each queue and the highest congestion status, respectively, because the congestion severity is determined by Age Severity based on the current age (delay in the queue) and Depth Severity (col. ~~6~~<sup>7</sup>, lines 27-45), i.e., the weight of the depth of each queue is applied to the delay for selecting a packet to be transmitted.

Regarding claim 2, McConnell further discloses that the current age is measured based on a time stamp for arrival time (col. 6, lines 64-66), i.e., the difference between a current time and arrival time is calculated for the delay.

Regarding claims 14 and 16, refer to the discussion for the claims 1 and 3. McConnell discloses a link scheduler (frame server 58 in FIG. 3).

Regarding claim 15, refer to the discussion for the claim 2.

Regarding claim 27, refer to the discussion for claim 1. McConnell discloses a processor (frame server 58 in FIG. 3).

#### ***Allowable Subject Matter***

4. Claims 4-13 and 17-26 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
